Based organisations from managing vertical to managing horizontal. The organisations started to become process orientated instead of function orientated, and new management styles, like total quality management, just in time, benchmarking, or business process reengineering appeared. Which lead into an increase of

overheads. (Drury 2004a) The most important cost factors changed from direct costs like labour costs or materials, into indirect costs like set-up costs or administration costs. Therefore the traditional costing systems became more or less useless, because they presented poor cost information, which leads into

decision errors. Therefore the ABC-
system of cost calculation seems to be a
solution. The most important difference
between traditional systems, and the ABC
system, is the breakdown of overheads. In
traditional costing systems, they are
divided into cost centres, and accumulated
products by using direct cost drivers. In

Based ABC system, they will be assigned to activities, which creates a greater number of cost centres with different cost drivers. They will be accumulated to products in the percentage of usage of an activity. In this paper the ABC-system of cost calculation is discussed and how it can be implemented successfully within an

organisation. Attention is also drawn to the most important failure in implementation of an ABC-approach, which should be avoided. To establish an ABC-approach within an organisation more than just a new calculation system is needed. An ABC-approach has to be implemented in the management system (ABM) and in the

Activity-based costing (ABC) is a cost
accounting concept that can be used by
almost any corporation (manufacturing or

In the classroom, ABC looks like a great way to manage a company's resources. But many executives who have tried to implement ABC on a large scale in their organizations have found the approach limiting and frustrating. Why? The employee surveys that companies used to estimate resources required for business

activities proved too time-consuming, expensive, and irritating to employees. This book shows you how to implement time-driven activity-based costing (TDABC), an easier and more powerful way to implement ABC. You can now estimate directly the resource demands imposed by each business transaction,

product, or customer. The payoff? You spend less time and money obtaining and maintaining TDABC data—and more time addressing problems that TDABC reveals, such as inefficient processes, unprofitable products and customers, and excess capacity. The authors also show how to use TDABC to link strategic planning to

operational budgeting, to enhance the due diligence process for mergers and acquisitions, and to support continuous improvement activities such as lean management and benchmarking. In presenting their model, the authors define the two questions required to build TDABC: 1) How much does it cost per

time unit to supply resource capacity for each business process? 2) How much resource capacity (time) is required to perform work for a company's many transactions, products, and customers? The book demonstrates how to develop simple, valid answers to these two questions.

It illustrates the chances of ABC as a decision making tool to provide management benefits regarding the

demands imposed by each transaction, product, or customer, rather than rely on time-consuming and costly employee surveys. In their new model, Kaplan and Anderson focus on the two parameters managers need to estimate: how much it costs per time unit to supply resources to the business activities (the total overhead

Based first gained publicity in the early 1980s. It was developed as a logical alternative to traditional cost management systems that tended to produce insufficient results when it came to allocating costs. Harvard Business School Professor Robert S. Kaplan was an early advocate of the ABC system. Due to a changing business
