Impact Analysis of COVID-19 on the Worldwide Digital ... Dental caries is a breakdown of teeth due to acids produced by bacteria. It is also called as tooth decay or cavity. The bacteria tends to convert sugar and carbohydrates (starches) present in the foods to acids. This acid dissolves minerals in the hard enamel that covers the tooth's crown and results in enamel erosion or pits/plaque on the tooth.

Insight Dental

Abstract. Dental caries is a biofilm-dependent oral disease, and fermentable dietary carbohydrates are the key environmental factors involved in its initiation and development. However, among the carbohydrates, sucrose is considered the most cariogenic, because, in addition to being fermented by oral bacteria, it is a substrate for the synthesis of extracellular (EPS) and intracellular (IPS) polysaccharides.

The role of sucrose in cariogenic dental biofilm formation ...

The term 'dental caries' implies cavities and tooth decay. Tooth decay primarily occurs due to bacteria that include *Streptococcus sobrinus* and various mutans. These bacteria convert glucose or fructose present in the mouth to acids such as lactic acid. The tooth enamel gets destructed or damaged due to acids produced by bacteria.
