Abstract. Mast cells have existed long before the development of adaptive immunity, although they have been given different names. Thus, in the marine urochordate *Styela plicata*, they have been designated as test cells. However, based on their morphological characteristics (including prominent cytoplasmic granules) and mediator content (including heparin, histamine, and neutral proteases), test cells are thought to represent members of the lineage known in vertebrates as mast cells.

Progression of mast cell diseases: Part 1.
Among mast cell patients, we generally assume that a designation of SM means indolent systemic mastocytosis (ISM.) However, in research papers, this term can mean ISM, SSM, ASM or MCL. Advanced SM usually means ASM or MCL. These terms generate a lot of confusion in the patient population.

Mast cells are a major driver in the onset and progression of celiac disease. Celiac.com 05/18/2017 - Researchers understand pretty well that celiac disease is driven in part by an accumulation of immune cells in the duodenal mucosa as a consequence of both adaptive and innate immune responses to undigested gliadin peptides. Mast cells are innate immune cells that produce a majority of co-stimulatory signals and inflammatory mediators in the intestinal mucosa.

The significant role of mast cells in cancer
Mastocytosis is a condition where certain immune cells, called mast cells, build up under the skin and/or in the bones, intestines and other organs. This abnormal growth of mast cells causes a range of symptoms, including itchy bumps on the skin, gastrointestinal (GI) issues such as diarrhea, and bone pain.

Connective Tissue Tumors in Dogs. Mast cells are cells that reside in the connective tissues, especially those vessels and nerves that are closest to the external surfaces (e.g., skin, lungs, nose, mouth). Their primary functions include defense against parasitic infestations, tissue repair, and the formation of new blood vessels (angiogenesis). They are also associated with allergic reactions, since they contain several types of dark granules made up of

Systemic mastocytosis (SM) is a form of mastocytosis in which mast cells accumulate in internal tissues and organs such as the liver, spleen, bone marrow, and small intestines. It is typically diagnosed in adults. Signs and symptoms vary based on which parts of the body are affected. The disorder is usually caused by somatic changes (mutations) in the KIT gene.
