It is the first book to focus on the mathematical modeling of structural dynamics, unsteady aerodynamics, and control systems to evolve a generic procedure to be applied for ASE synthesis. Existing robust, nonlinear, and adaptive control methodology is applied and extended to some interesting ASE problems, such as transonic flutter and buffet, post-stall buffet and maneuvers, and flapping flexible wing.

A control approach exploiting the pressure to angle mapping is discussed in Section 4, together with a learning scheme based on the gray-box model to improve control performance. Results from angle tracking experiments for different joint stiffness levels and after applying a learning scheme are presented in Section 5 and a conclusion is drawn in Section 6 .

A dynamic system model for simulating the transient performance of a NO_x aftertreatment system using Selective Catalytic Reduction with urea as a reductant (urea-SCR) was developed, calibrated for a heavy-duty engine application, and used to develop a closed loop self-tuning control strategy. The closed loop controller was able to reduce the FTP cycle NO_x emissions from a Cummins heavy-duty ...
