Fowl pox is a worldwide disease of poultry caused by viruses of the family Poxviridae and the genus Avipoxvirus. There are two forms of the disease. The first is cutaneous form (dry pox) that is spread by biting insects, especially mosquitoes that causes lesions on the comb, wattles, and beak.

VIRAL DISEASES | Zoology for IAS, IFS and other ...

A zoonosis (plural zoonoses, or zoonotic diseases) is an infectious disease caused by a pathogen (an infectious agent, such as a bacterium, virus, parasite or prion) that has jumped from a non-human animal (usually a vertebrate) to a human. Typically, the first infected human transmits the infectious agent to at least one other human, who, in turn, infects others.

Zoonosis - Wikipedia

epizootic haemorrhagic virus disease; It is also important to limit or prevent contact of deer with neighbouring livestock, and to be aware of the health status of any animals bought or sold.

Viruses: What are they and what do they do?

Description of the disease. Bluetongue is a non-contagious, insect-transmitted, viral disease of domestic and wild ruminants. It is not known to affect humans. Disease characteristics - The disease is characterised by inflammation of the mucous membranes, congestion, swelling and haemorrhages. Sheep are generally the worst affected, while cattle and goats do not usually show any clinical signs of disease and can carry the virus for a certain period of time and transmit it to other ruminants.
